API de pessoas: integrações

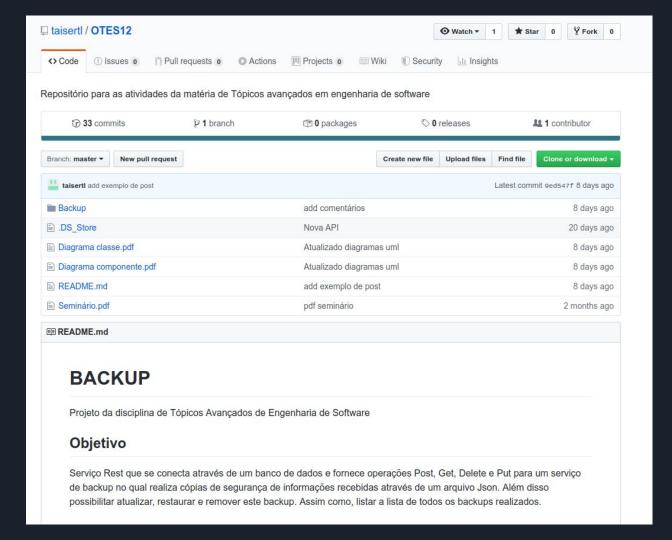

Pedro Germano Cervi

Diagrama de classes

Integrações

Backups - Código (chamada API)

```
Adapters::BackupServiceAdaptee
def create_backup
   payload = {
        arquivo: database_client.index(nil).to_json
    }

HTTParty.post(
        backup_service_route,
        body: payload.to_json,
        headers: { 'Content-Type' => 'application/json' }
)
rescue StandardError => e
   puts e
end
```

```
def backup_service_route
   if ENV['RAILS_ENV'] == 'production'
    ENV['BACKUP_SERVICE_URL'] + '/' + ENV['BACKUP_SERVICE_NAMESPACE']
   else
    BACKUP_SERVICE_URL + '/' + NAMESPACE
   end
end
```

Heroku config vars

https://dashboard.heroku.com/apps/salty-cove-05656/settings

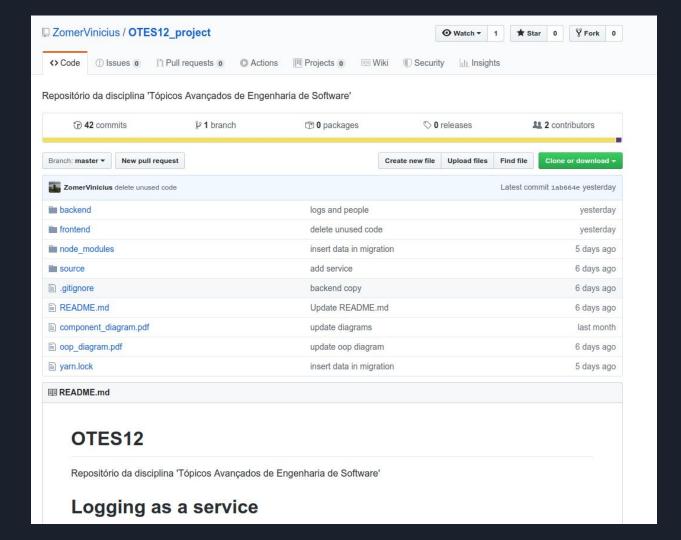

Backups - Código (uso)

```
<div>
     <h4>Salvar backup</h4>
     <form action="/create_backup">
          <input type="submit" value="Salvar">
          </form>
</div>
```

```
BackupsController
def create
  result = backup_service_client.create_backup
  render json: result.to_json
end
```

Backups - Demonstração

https://salty-cove-05656.herokuapp.com/backups

Logs - Código (chamada API)

```
def create info log(params, person, action)
  payload = {
    description: "Action: #{action}, Person: #{person.to json}, Params: #{params}}"
 HTTParty.post(
    logger route,
   body: payload.to json,
   headers: { 'Content-Type' => 'application/json' }
rescue StandardError => e
 puts e
def loas
  response = HTTParty.get(
    logger route,
   headers: { 'Content-Type' => 'application/json' }
 JSON.parse(response.body)
rescue StandardError => e
 puts e
ENV['LOGGER URL'] # '/' + ENV['LOGGER NAMESPACE'] + '/' + ENV['LOGGER SERVICE ID']]
```

Logs - Código (uso)

```
PeopleController
 f create
 person = Builders::PersonBuilderDirector.new(params).person
 if person.errors.present?
   logger client.create error log(params, person.errors, action name)
   return render json: "Errors: #{person.errors}.\n"
   database client.create(person)
   logger client.create info log(params, person, action name)
   render json: "person id: #{person.id}\n"
rescue StandardError => e
 logger client.create error log(params, e, action name)
 render json: "error: #{e}\n"
```

Logs - Demonstração

Interface de Pessoas - Código

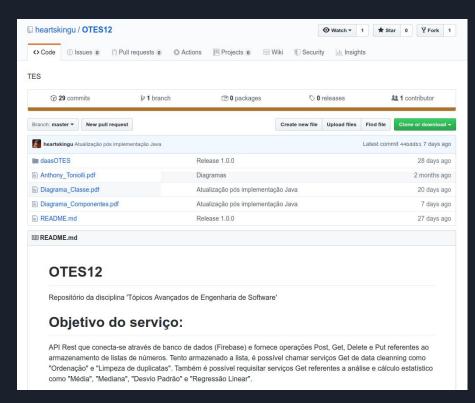

```
<div><h2>Criar pessoa</h2></div>
<div><h4><a href="/">home</a></h4></div>
<form method="post" action=<%= "/people" %>>
 <input type="text" name="email">
  . . .
  >
 <input type="text" name="credit card flag">
  <input type="submit" value="Salvar">
</form>
```

Estatísticas

Estatísticas - Código (chamada API maas)

```
Adapters::MonitorServiceAdaptee
   start
  payload = {
    name: 'People API',
    description: 'Database restoration'
 HTTParty.post(
    "#{monitor service route}/start",
    body: payload.to json,
    headers: { 'Content-Type' => 'application/json' }
rescue StandardError => e
 puts e
end
```

Estatísticas - Código (chamada API)

```
# Adapters::StatisticsServiceAdaptee
def save numberlist(numbers)
  payload = {
    numberList: numbers
  HTTParty.post(
    statistics service route,
    body: payload.to json,
    headers: { 'Content-Type' => 'application/json' }
rescue StandardError => e
  puts e
def sort desc(id)
  HTTParty.get(
    "#{statistics service route}/sortdesc/#{id}",
    headers: { 'Content-Type' => 'application/json' }
rescue StandardError => e
  puts e
end
```

Estatísticas - Uso

```
HomeController
    statistics
  people api data = monitor service client.statistics data
 @totals = []
  people api data.each do |data|
    if data['finalizado']
      @totals << data['total']</pre>
 number list result = statistics service client.save numberlist(@totals)
 number list id = JSON.parse(number list result.body)['id']
 @median = statistics service client.median(number list id).parsed response
 @average = statistics service client.average(number list id).parsed response
 @sort desc = statistics service client.sort desc(number list id).parsed response["numberList"]
end
```

Estatísticas - Demonstração

https://salty-cove-05656.herokuapp.com/statistics

Backups - Código (uso)

```
BackupsController
 restore
monitor response = monitor service client.start
monitor id = JSON.parse(monitor response.body)['id']
result = backup service client.get backup(params[:id])
file = JSON.parse(result.body)['arquivo']
people from file = JSON.parse(file)
if people from file.present?
  people = database client.index(nil)
  people.destroy all
  people from file.each do | person|
    restored person = Person.new(person)
    database client.create(restored person)
monitor finish response = monitor service client.finish(monitor id)
parsed response = JSON.parse(monitor finish response)
total time = parsed response['total'].to f / 1000.0
render json: { total: "#{total time} segundos" }.to json
```
